Lecture 7

Hello Gophers

```
3 package main
4
5 import "fmt"
6
7 func main() {
8         fmt.Println("Hello, punk bitches")
9 }
```

package main → Any GO program that's going to be an executable

has to have a package main

→ Packages are a way to organize code

→ It's similar to how we organize our files on a computer by having folders and put content inside

func main → Inside package main, we need a func main

→ This is where our program starts and ends

→ func keyword represents functionality

import fmt → We have imported a package from the standard library

→ We did it to be able to use the Println() function
